

Resume Parsing & Skill Extraction

When the candidate uploads a resume, SwipeX extracts the text from the resume and identifies the candidate's skills. The extracted skills are cleaned, normalized, and used for job matching and recommendations.

ATS Score

ATS gives a **0–100 score** showing how well the candidate matches a particular job.

- **Skills Match – 50%**
- **Experience Match – 20%**
- **Semantic Similarity – 20%**
- **Education Match – 10%**

Required and preferred skills are combined into the Skills Match, with **required skills given higher importance**.

AI Recommendation

The recommendation system first removes jobs that the candidate has already swiped on. It then ranks the remaining jobs using:

- **Skill Match – 70%**
- **Experience Match – 20%**
- **Role Relevance – 10%**

After the candidate has more than **5 swipes**, the ML model can use their **Like/Reject swipe history** to personalize the job ranking.

Resume Parsing & Skill Extraction

When the candidate uploads a resume, SwipeX first extracts the text from the **PDF/DOCX resume** using a resume parser. The extracted text is cleaned and processed to identify important information such as **skills, education, experience, and other profile details**.

For skill extraction, the system checks the resume text against a predefined **skill vocabulary** using NLP-based matching. The detected skills are normalized and stored in the candidate profile, where they are later used for **ATS scoring and AI job recommendations**.

Flow:

Resume Upload → Text Extraction → Text Cleaning → Skill Extraction → Skill Normalization → Candidate Profile
